#2 Verification is needed to prevent corrupted and invalid data

The current behaviour is users can change all of the registered information even with invalid data such as invalid email address, mobile number and date of birth.

A proper verification and error handling solution may be required to enhance the user experience.

#3 Users may be able to edit the registered detail although they log out

Enhancement needed, the credential is stored in the cookie so when user logs out and navigates the previous page(edit profile page) user is still able to edit the profile info.
